Guidance for Dying Patients Severn Hospice
Pain Flow Chart
Nausea and Vomiting Flow Chart
Restlessness/Agitation Flow Chart
Respiratory Secretions Flow Chart
Breathlessness Flow Chart

Appendix 2:

Information Sheet for Relatives/Friends

Appendix 3:

Community prescription/syringe pump sheets and Nursing Continuation Sheets to be added by community teams as needed

Written by Shropshire Clinical Commissioning Group, Telford and Wrekin Clinical Commissioning Group, Shrewsbury and Telford Hospital NHS Trust, Shropshire Community Health NHS Trust, Severn Hospice and Shropshire Partners in Care.
Preface

This End of Life Plan has been created to address the holistic needs of the dying person by providing supportive and compassionate person-centred care. It is imperative that all treatment and care provided is of the highest standard and quality. This care must be respectful and dignified and delivered by all involved in a spirit of cooperation and collaboration. The dying person and their family must be at the centre of all care provided. To achieve this, the principles of dignity conserving care\(^1\) will be adopted to guide all decisions and care provided.

<table>
<thead>
<tr>
<th>A. Attitudes</th>
<th>Those caring for the dying must examine their own attitudes and assumptions towards death and dying. Positive attitudes will ultimately shape the experience of those in receipt of end of life care.</th>
</tr>
</thead>
<tbody>
<tr>
<td>B. Behaviour</td>
<td>Behaviour stems from attitudes and values. Behaviour should be predicated on kindness and respect. This can be reflected in the way even the smallest acts of care are performed. The aim of this End of Life Plan is to affirm the worth and self-esteem of the dying patient and their family.</td>
</tr>
<tr>
<td>C. Compassion</td>
<td>Compassion is about recognising the suffering and pain in another and having the desire to alleviate and relieve this for the dying person. Compassion is more than just an intellectual awareness, it is something far deeper. Compassion moves beyond physical acts of care as it is felt and experienced emotionally and spiritually. Compassion is communicated through verbal and non-verbal channels, for example the way we approach the dying person or use touch to convey presence offering reassurance.</td>
</tr>
<tr>
<td>D. Dialogue</td>
<td>Dialogue is the outcome of A, B, C working synonymously and effectively. Attitudes, behaviours and compassion will lead to a deeper engagement and understanding of the needs of the individual and their family and friends. Dialogue is about elucidating the personal narrative and biography of the individual. It is about knowing who they are and, glimpsing their own unique dignity and identity. Therefore, dialogue is essential if the dying person is to be understood and have their personhood affirmed. Dialogue is not a one-off activity but a continuous and cyclical process that captures and supports the dignity of the dying person as situations and needs change.</td>
</tr>
</tbody>
</table>

Adoption and adherence of these principles will provide a framework for promoting and preserving the dignity of the dying person. It involves all those involved in the implementation of the End of Life Plan being reflective and prepared to change long established attitudes and behaviours that may have a negative and detrimental impact on end of life care.

Fundamentally, the framework places the dying person and their dignity/identity at the centre of care delivery encouraging dialogue and a compassionate approach. The A, B, C, D will foster an environment and relationships where trust, honesty and openness flourish and the dignity of all is conserved.

Patient Name: __________________________ DOB: ____________________
NHS Number: ______________

Diagnosing dying and using the End of Life Plan to support care in the last hours or days of life

Assessment

Deterioration in the patient’s condition suggests that the patient could be dying – patient may be more drowsy, less communicative, unable to swallow easily, observations may be deteriorating

Multidisciplinary team (MDT) assessment
- Is there a potentially reversible cause for the patient’s condition e.g. exclude opioid toxicity, renal failure, hypercalcaemia, infection
- Could the patient be in the last hours or days of life?
- Is Specialist referral needed? e.g. specialist palliative care or a second opinion

Patient is NOT diagnosed as dying (in the last hours or days of life)

Review current plan of care, escalate care as appropriate and communicate new plan to patient and relatives

Patient is diagnosed as dying (in the last hours or days of life)

Patient, relative or carer communication is focused on recognition & understanding that the patient is dying

Discussion with the patient, relative or carer (IMCA if lacks mental capacity and is un-befriended) to explain the use of the End of Life Plan

Management

The End of Life Plan should be used to support care of the patient and family on the ward, in their care home or in their own home

Communication

Reassessment

The use of the End of Life plan should guide care and the patient’s condition should be regularly reassessed - see Page 8 for more details of reassessment

Further help and advice on caring for dying patients is available from Severn Hospice (01743 236565 & 01952 221350). Their nurses and doctors are available 24/7.
Patient Name: __________________________ DOB: __________________

NHS Number: __________________________

Initial assessment (to be completed by medical staff known to the patient)

The decision to use the End of Life Plan should be made by the doctor in charge of the patient’s care. For patients at home, this plan must be initiated by the patient’s GP, usually in conjunction with the district nursing team. The practice computer should be used to record additional information and the District Nursing team should continue to use their own records. In residential or nursing homes, the End of Life Plan should be completed by a GP and senior nurse/care manager.

- The patient should be ‘flagged’ with the out of hours medical team as receiving end of life care. This can be done by telephoning the Care Co-ordination Centre on 0333 222 66 55 or using your GP practice online login at https://shropdoc.advhc.net/awa
- Please issue a just in case box in the community with anticipatory prescribing and complete the prescription sheet
- Please consider fast tracking the patient to the Continuing Health Care team by telephoning your local CCG

In hospice or hospital, this plan should be completed by a senior doctor at registrar level or above in conjunction with the most senior nurse on the ward, usually a ward sister or charge nurse. Discussions with the patient and their relatives should be recorded in full. In hospital, this document should be completed and filed in the current admission section of the medical records and/or within nursing documentation. The community kept within patients homes, care home within patient records. The medical/nursing records should continue to be used for documentation after this initial assessment has been carried out and the following 3 pages completed.

Date of decision to use this plan: __________________________ Time: __________________

Name/Signature of decision-makers: __________________________

Grade: __________________________

Name of person completing document: __________________________ Grade: __________________________

Name of Consultant (if in Hospital) or GP if different from above: __________________________

Informed? Yes ______ Date and Time: __________________________

(Please make the patient’s usual team aware at earliest convenience)

Death very likely to occur in the next few hours and days and potentially reversible causes have been considered:

Main diagnosis if known-

Comments:

Patient’s preferred place of care (home, hospital, hospice, care home, other) discussed with patient and family/carers, and discharge home has been considered if patient is in hospital.

If in hospital and wishing to go home for end of life care consider fast track checklist / communication with pharmacy re medication for discharge.
Discontinuing inappropriate interventions

<table>

Do Not Resuscitate decision

Do Not Resuscitate (DNR) / Allow Natural Death (AND) form already completed □
DNR/AND form completed now □

Implantable Cardioverter Defibrillators (ICD) if present needs to be deactivated – contact cardiorespiratory at PRH or RSH, or CCU out of hours via the hospital switch board RSH 01743 261000 or PRH 01952 641222
Advance directive completed □
Lasting power of attorney (Health and Welfare) □

Artificial hydration and nutrition

Support patient to take fluids by mouth for as long as they can. For most patients the use of artificial hydration and nutrition will not be required. A reduced need for fluids is part of the normal dying process and should be explained to patients and relatives.

Any artificial hydration & nutrition e.g. nasogastric or PEG feeds should be discontinued or reduced when patients are dying. Patients should be supported to eat as they feel able.

Good mouth care is essential. Symptoms of thirst / dry mouth do not always indicate dehydration but are often due to mouth breathing or medication.

Decision made at time of initial assessment that clinically assisted hydration is:
Not required □
Discontinued □
Continued □
(If in place consider reduction in rate / volume according to individual need. If required consider the s/c route, please briefly document reasons for decision Rationale and explanation discussed with patient and/or family) □
Anticipatory Prescribing

The patient should have medication prescribed on an as needed basis for all of the following symptoms which may develop in the last hours or days of life:

<table>
<thead>
<tr>
<th>Symptom</th>
<th>Medication</th>
</tr>
</thead>
<tbody>
<tr>
<td>Pain</td>
<td>Diamorphine 2.5-5mgs s/c prn if opioid naïve</td>
</tr>
<tr>
<td>Agitation</td>
<td>Midazolam 2.5-5mgs s/c prn or Haloperidol 2.5mg s/c</td>
</tr>
<tr>
<td>Respiratory secretions</td>
<td>Hyoscine Butylbromide 20 mg s/c prn</td>
</tr>
<tr>
<td>Nausea / Vomiting</td>
<td>Levomepromazine 6.25mgs</td>
</tr>
<tr>
<td>Breathlessness</td>
<td>Diamorphine 2.5-5mgs +/- Midazolam 2.5-5mgs s/c prn</td>
</tr>
</tbody>
</table>

Anticipatory prescribing will ensure that there is no delay in responding to a symptom if it occurs – please refer to the flow charts at the end of the plan for more guidance.

If a T34 (syringe pump) is to be used, explain the rationale to the patient, and/or family/carer. In the community complete the syringe pump sheet. Not all patients who are dying need a syringe pump.

If medicines are issued in the community to a patient in advance of a deterioration in their condition (‘just in case’) then the community prescribing sheet must be completed, by the prescriber assessing the patient, when the decision is made to initiate the drugs.

Current symptoms (please tick all that apply):

<table>
<thead>
<tr>
<th>Symptom</th>
<th>Current Symptoms</th>
</tr>
</thead>
<tbody>
<tr>
<td>Pain</td>
<td>Difficulty swallowing</td>
</tr>
<tr>
<td>Agitation</td>
<td>Constipation</td>
</tr>
<tr>
<td>Nausea or vomiting</td>
<td>Faecal incontinence</td>
</tr>
<tr>
<td>Breathless</td>
<td>Urinary incontinence</td>
</tr>
<tr>
<td>Respiratory tract secretions</td>
<td>Confusion/delirium</td>
</tr>
</tbody>
</table>

Other symptoms (please describe):

Patient/carer concerns at initial assessment (can be completed by medical or nursing staff) including important information about family circumstances or requests from the patient and their family/carers regarding their care.
Spiritual Issues

Please document any spiritual issues here. Spiritual issues may involve exploring personal, religious or spiritual beliefs including questions of faith, in self, others and for some people this may include belief in God, deity or higher power. Therefore, with the consent of the patient/next of kin, there may be a need to refer to the person's own religious / faith representative or chaplain. Spiritual issues may also involve questions about hope, trust, meaning and purpose and forgiveness. It may require discussion about peoples’ values, love and relationships and questions about morality or what is fundamental to the preservation of their dignity and self-identity. Spiritual issues may also be expressed through creativity such as art, music and poetry.
Patient Name: ___________________________ DOB: __________________

NHS Number: _______________________

**Repeat Assessment**

Undertake an MDT assessment & review of the current management plan if:

- Improved conscious level, functional ability, oral intake, mobility, ability to perform self-care
- Concerns expressed about plan by patient, relative or team member
- It is 3 days since the last assessment

Consider the support of the specialist palliative care team and/or a second opinion as required. Document reassessment dates and times in the medical and nursing notes. Please use the nursing continuation sheets for the End of Life Plan if the patient is being looked after at home.

If the patient improves and is no longer expected to die within the next few days then the End of Life Plan should be discontinued:

Date and Time End of Life Plan discontinued: ______/______/_______ at __________

Reasons End of Life Plan discontinued:

_____________________________________________________________________________
_____________________________________________________________________________
_____________________________________________________________________________
_____________________________________________________________________________

Name/Sign: ________________________________________________________________
Patient Name: _______________________________   DOB: ____________________

NHS Number: _______________

Care After Death

Verification of Death (please document here if patient dies at home or in a nursing/residential home, otherwise use the medical notes)

Verification of Death carried out as per policy/guidance and documentation completed  □

Date of patient’s death: ______/_______/_______   Time of patient’s death:_________________

Details of healthcare professional who verified death:

Name: ___________________________________________ (please print)

Position: ________________________________________

Signature: ______________________________________

Contact telephone number: ________________________

Comments: _______________________________________

Persons present at time of death: ______________________

Relative / carer present at time of death: Yes □  No □

If not present, have they been notified: Yes □  No □

Is there any requirement for the medical team to inform / discuss with the coroner’s office?
Yes □  No □   If Yes, Comments:

Any special requirements after death?

E.g. any cultural or religious requirements

Care after Death have been undertaken: Yes □  No □

Conversation with relative or carer explaining the next steps: Yes □  No □

‘What to do after a death’ or equivalent booklet given to relative: Yes □  No □

Document to be taken by District Nurses for storage in the Community / in Care Homes store in patient notes.
Prescribing Guidance for Dying Patients

Most patients are comforted by the knowledge that medication is helpful and available if required at the end of their life.

The following flow charts are to be used as a guide for patients in their last hours of life. Further information is available from the West Midlands Palliative Care Physicians “Guidelines for the use of drugs in symptom control” www.wmpcg.co.uk and the Palliative Care Formulary.

Please follow the below link for Opioid Conversion Guidance and other useful information.

http://www.severnhospice.org.uk/for-healthcare-professionals/gp-info-hub/

Review drug/ dose/ frequency for patients who are elderly, frail, have dementia or renal failure and seek advice.
PAIN AT THE END OF LIFE

Is patient already on opioid drugs and unable to tolerate or absorb oral medication?

**YES**

Patient on MR Morphine/Oramorph
- Divide 24 hour total dose of current oral Morphine by 3 and prescribe this as Diamorphine (mgs) via syringe pump over 24 hours
- Prescribe 1/6th Diamorphine syringe pump dose for breakthrough/rescue medication to be given hourly if needed
- Start syringe pump 4 hours before next oral opioid dose would have been due
- Discontinue oral opioid

Review within 24 hours
If extra medication has been needed for pain:
- Increase syringe pump dose by total amount of rescue Diamorphine given or by 50% whichever is less
- Adjust rescue/breakthrough dose to 1/6th of syringe pump Diamorphine dose to be given hourly if needed
If pain is controlled, make NO changes
Continue to review dose requirements regularly

Patient on weak opioid
(Codeine, Tramadol, Dihydrocodeine)
- Stop oral weak opioid
- Start Diamorphine 10mg/24 hrs by syringe pump soon after last oral dose
- Prescribe Diamorphine 2.5mg sub-cut hourly if needed for rescue/breakthrough pain
Review regularly and adjust as above

Fentanyl patch: continue patch and supplement with sc Diamorphine prn and add in a syringe pump if needed.
Renal impairment: GFR < 30 seek advice

**NO**

Scenario 1: “planning ahead”
Patient not in pain
- Prescribe Diamorphine 2.5mg - 5mg sub-cut hourly if needed
- If patient later develops pain, proceed to next box

Scenario 2: “act now”
Patient in pain
- Give Diamorphine 2.5mg sub-cut stat
- Prescribe and start Diamorphine 10mg/24h by syringe pump
- Prescribe Diamorphine 2.5mg sub-cut for rescue/breakthrough pain to be given hourly if needed

Review within 24 hours
If extra medication has been needed for pain:
- Increase syringe pump dose by total amount of rescue mediation given or to 20mg/24hrs, whichever is less
- Increase rescue/breakthrough dose of Diamorphine to 5mg sub-cut to be given hourly if needed
If pain is controlled, make NO changes
Continuing care
- A combination of Diamorphine and Midazolam may be needed.
- If >2 rescue doses given hourly if needed, make NO changes
- If 2 or more doses needed, manage as for breathless patient
- Review within 24hrs

If symptoms persist or you need advice please contact the Palliative Care Team or Severn Hospice.
NAUSEA AND/OR VOMITING AT THE END OF LIFE

Important note: this guidance applies to the end of life ONLY

Effective palliation of nausea and vomiting earlier in the illness requires a cause-specific approach

Patients entering the terminal phase with good symptom control from an oral anti-emetic should continue the same drug given via a syringe pump when they are unable to take oral medication.

Domperidone should be replaced by Metoclopramide and Prochlorperazine (stemetil) by Cyclizine.

For new symptoms of nausea/vomiting that are difficult to control Levomepromazine (Nozinan) is recommended because of it’s broad spectrum of action.

Patient has new or uncontrolled nausea/vomiting

Give Levomepromazine 6.25mg sub-cut stat (a once daily dose may be sufficient because of the long half life)
Also prescribe Levomepromazine 6.25mg sub-cut as needed
Dose may be repeated after 1 hr
If repeat dose needed, initiate syringe pump

In some settings, eg community, it may be appropriate to give a stat dose of
Levomepromazine sub-cut AND start a syringe pump with Levomepromazine at the same time

Patient has no nausea/vomiting OR n/v controlled on existing medication

Prescribe Levomepromazine 6.25mg sub-cut as needed in case nausea/vomiting become a problem in the terminal phase.
This can be repeated after 1 hr if needed

If 2 or more doses are needed in 24 hrs, start syringe pump with Levomepromazine 12.5mg/24hrs
Continue Levomepromazine 6.25mg sub-cut as needed, leaving 1 hr between doses (max 4 doses). If 1 or more extra doses needed in 24 hrs increase syringe pump to 25mg/24 hrs

Levomepromazine doses above 25mg/24 hr has a sedative effect.

If nausea and/or vomiting are not controlled adequately at any stage, contact palliative care team for advice

If symptoms persist or you need advice please contact the Palliative Care Team or Severn Hospice.
**RESTLESSNESS / AGITATION AT END OF LIFE**

**Consider and manage common causes of restlessness**, eg. Urinary retention, faecal impaction, hypoxia and pain.

<table>
<thead>
<tr>
<th>PATIENT IS RESTLESS/AGITATED</th>
<th>PATIENT IS NOT RESTLESS/AGITATED</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Non-drug intervention is essential:</strong> re-assurance, calm environment, consider the use of sound / music. Have you taken into account their spiritual needs?</td>
<td></td>
</tr>
</tbody>
</table>

**Immediate management**

<table>
<thead>
<tr>
<th>Give medication sub-cut stat:</th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>Midazolam 2.5 - 5mg OR Haloperidol 2.5mg</td>
<td></td>
</tr>
</tbody>
</table>

**Start syringe pump:**

| Midazolam 10 - 20mg/24h OR Haloperidol 5mg/24h |  |

**Prescribe rescue doses sub-cut hourly:**

| Midazolam 2.5 - 5mg AND/OR Haloperidol 2.5mg |  |

**Review within 24 hours**

**Midazolam:**

- 1-2 extra doses, increase driver dose by 50%
- 3 or more extra doses, double driver dose
- Continue rescue doses of 5mg sub-cut prn
- If Midazolam driver dose>40mg/24hrs, consider Levomepromazine and seek advice.

**Haloperidol:**

- Any extra doses, increase driver dose to 10mg/24h and continue rescue doses
- Max haloperidol dose 20mg/24hrs

Midazolam and Haloperidol are very effective when used in combination

**Planning ahead**

Prescribe sub-cut hourly as needed

**Either**

- Midazolam 2.5mg OR Haloperidol 2.5mg

**Review within 24 hrs**

If 2 or more doses needed and are effective, start syringe pump of same drug (see left)

**If 2 or more doses tried but are not effective,**

- switch to the other drug or consider Levomepromazine (see below)

**Persistent symptoms**

**Levomepromazine:**

- Is an effective *sedative*
- It may be added to Midazolam (if Midazolam partly effective) or used to replace haloperidol.
- Start syringe pump at 25mg/24h
- Use rescue dose 12.5mg sub-cut hourly as needed

Higher doses are sometimes needed please discuss with the Drs, Palliative Care Team or Severn Hospice if doses over 50mg/24hrs are used

If symptoms persist or you need advice please contact the Palliative Care Team or Severn Hospice.

---

**BREATHLESSNESS AT END OF LIFE**

Terminal breathlessness is very frightening and must be treated as a serious symptom, untreated it can lead to escalation of symptoms, distress and terminal agitation.

**Use of medication:**

Patient not on opioid for pain

- Give Diamorphine 2.5mg sub-cut stat
- Prescribe hourly as needed for rescue dose
- Start Diamorphine 10mg/24hrs by syringe pump

Patient on MR Morphine/Oramorph

- Divide 24 hour total dose of current oral Morphine by 3 and prescribe this as Diamorphine (mgs) via syringe pump over 24 hours
- Prescribe 1/6th Diamorphine syringe pump dose for breakthrough/rescue medication to be given hourly if needed
- Start syringe pump 4 hours before next oral opioid dose would have been due
- Discontinue oral opioid (The above mimics pain flow chart above – if in pain and breathless DO NOT double doses)

**Review within 24hrs**

If 2 or more doses needed, manage as for breathless patient

**BREATHLESSNESS PRESENT RISK OF BREATHLESSNESS**

**General measures**

- Calm environment
- Reassurance and support
- Gentle air flow with fan (damp flannel around mouth)
- Cool room
- Give hourly mouth care
- Oxygen if helpful/Hypoxic

**Planning ahead**

Patient not on opioid for pain

Prescribe Diamorphine 2.5mg sub-cut hourly if needed

Consider Midazolam 2.5mg sub-cut hourly if anxiety likely to occur

**Review within 24hrs**

If >2 rescue doses needed in 24hrs,

- Increase the medication in the syringe driver
- A combination of Diamorphine and Midazolam may be needed.
- Continue rescue doses hourly as needed

Increase rescue dose of chosen drug to 5mg and continue hourly as needed

Continue to review regularly.

Modify syringe pump doses as needed, guided by rescue medication used.

**DO NOT STRUGGLE – SEEK HELP**

If symptoms persist or you need advice please contact the Palliative Care Team or Severn Hospice.

**Consider the following:**

- If anxiety continues Midazolam 2.5-5mg prn
- If bronchospasm a significant factor Add in inhaler/nebs/steroids
- If Pulmonary Oedema Furosemide (can be used s/c)
RESPIRATORY TRACT SECRETIONS IN A DYING PATIENT

Dying patients may be unable to cough effectively or swallow, which can lead to retained secretions in the upper respiratory tract. There is little evidence to support the effectiveness of drug treatment for this symptom. If the patient appears comfortable and not distressed reassure relatives and staff.

Hyoscine Butylbromide is our drug of choice to use for respiratory tract secretions at end of life

Hyoscine Butylbromide is non-sedating; Note it does not mix well with Cyclizine in a syringe and blocks the prokinetic antiemetic action of Metoclopramide

If rattling breathing is associated with breathlessness in a semiconscious patient add in an opioid +/- an anxiolytic sedative (midazolam)

SECRETIONS PRESENT

General management
- Give explanation and reassurance to relatives
- Alter position to shift secretions
- Discontinue parenteral fluids
- Give hourly mouth care

Drug treatment:
Hyoscine Butylbromide 20mg s/c
Start syringe pump
Hyoscine Butylbromide 60mg/24hr CSCI
Allow rescue doses 2 hrly sub-cut as needed

Review after 24 hrs or sooner
If rescue doses needed, increase driver dose
Hyoscine Butylbromide 120mg/24hr
Continuous Subcutaneous Infusion (CSCI)

SECRETIONS ABSENT

Planning Ahead
Patients may develop respiratory tract secretions
Prescribe Hyoscine Butylbromide 20mg sub-cut 2 hourly as needed

Review after 24hrs or sooner
If 2 or more doses needed, manage as for “secretions present”

Difficult cases
In heart failure, pulmonary oedema may cause a rattle. Consider furosemide s/c
In persistent cases, Glycopyrrolate 200-400mcg sub-cut as stat doses should be used as second line

If symptoms persist or you need advice please contact the Palliative Care Team or Severn Hospice.
BREATHLESSNESS AT END OF LIFE

Terminal breathlessness is very frightening and must be treated as a serious symptom, untreated it can lead to escalation of symptoms, distress and terminal agitation.

**BREATHLESSNESS PRESENT**

**General measures**
- Calm environment
- Reassurance and support
- Gentle air flow with fan (damp flannel around mouth)
- Cool room
- Give hourly mouth care
- Oxygen if helpful/Hypoxic

**Use of medication:**

**Patient not on opioid for pain**
- Give Diamorphine 2.5mg sub-cut stat
- Prescribe hourly as needed for rescue dose
- Start Diamorphine 10mg/24hrs by syringe pump

**Patient on MR Morphine/Oramorph**
- Divide 24 hour total dose of current oral Morphine by 3 and prescribe this as Diamorphine (mgs) via syringe pump over 24 hours
- Prescribe 1/6th Diamorphine syringe pump dose for breakthrough/rescue medication to be given hourly if needed
- Start syringe pump 4 hours before next oral opioid dose would have been due
- Discontinue oral opioid

(The above mimics pain flow chart above – if in pain and breathless DO NOT double doses)

**Consider the following:**

If anxiety continues
- Midazolam 2.5-5mg pm

If bronchospasm a significant factor
- Add in inhaler/nebs/steroids

If Pulmonary Oedema
- Furosemide (can be used s/c)

**RISK OF BREATHLESSNESS**

**Planning ahead**

**Patient not on opioid for pain**
Prescribe Diamorphine 2.5mg sub-cut hourly if needed
Consider Midazolam 2.5mg sub-cut hourly if anxiety likely to occur

**Review within 24hrs**
If 2 or more doses needed, manage as for breathless patient

**Review within 24hrs**
If >2 rescue doses needed in 24hrs,
- Increase the medication in the syringe driver
- A combination of Diamorphine and Midazolam may be needed.
- Continue rescue doses hourly as needed

Increase rescue dose of chosen drug to 5mg and continue hourly as needed

Continue to review regularly.
Modify syringe pump doses as needed, guided by rescue medication used.

**DO NOT STRUGGLE – SEEK HELP**

If symptoms persist or you need advice please contact the Palliative Care Team or Severn Hospice.
Information sheet for relatives / friends following a discussion about end of life care.
The doctors and nurses will have explained to you that there has been a change in your relative’s condition. They believe that they are now in the last hours or days of life.

The End of Life Plan helps doctors and nurses to give the best care to your relative. You will be involved in the discussion regarding the plan of care with the aim that you fully understand the reasons why decisions are being made. If your relative’s condition improves then the plan of care will be reviewed and changed.

• Communication
Written information leaflets like this one can be useful, as it is sometimes difficult to remember everything at this time. The doctors and nurses will ask you for your contact details, as keeping you updated is a priority. There is space at the bottom of this leaflet to jot down any questions you may have for the doctors and nurses.

It can be very difficult to predict precisely when someone who is dying will pass away. For some relatives and friends it is very important that they are present at the moment of death. Others will feel they have already said their goodbyes. Please let us know your specific wishes so that we can try and ensure that they are carried out.

• Medication
Medicine that is not helpful at this time may be stopped. People often find it difficult to swallow lots of tablets. Some new medicines may be prescribed and these are often given as a small injection under the skin. Medicines for treating symptoms such as breathlessness, pain or agitation will be given when needed. Sometimes they can be given continuously in a small pump called a syringe pump, which can help to keep patients comfortable.

• Reduced need for food and drink
Loss of interest in eating and drinking is part of the dying process and it can sometimes be hard to accept. Your relative will be supported to eat and drink for as long as they want / are able to.

If a patient is in hospital and cannot take fluids by mouth, a drip may be considered, or may have been started before it became clear that your loved one is dying. Fluids given by a drip will only be used where it is helpful and not harmful. These decisions will be explained to you.

Good mouth care is very important at this time and can be more important than fluids in a drip in terms of feeling comfortable. The nurses will explain to you how mouth care is given and may ask if you would like to help them give this care.

• Changes in breathing
When someone is dying, their need for oxygen may lessen and the way they breathe may change. People who have been breathless may feel less breathless at this time. Their breathing may pause for a while and then start again. They use different muscles to breathe, which means their breathing may look different. Sometimes breathing can sound noisy or “rattling” because the person is no longer able to cough or clear their throat. This can sound upsetting but is generally not distressing for them.

• Changes in how the person looks and behaves
During the process of dying, a person’s skin may become pale and moist. Their hands and feet can feel very cold and sometimes look bluish in colour. Dying people often feel very tired and will sleep more. Even when they are awake, they may be drowsier than they have been and they will be awake less and less. They may still be aware of the presence of family and friends so you can still talk to them.
Support for family and friends

It is sometimes easier to cope with things at this difficult time if you have someone outside your immediate family to talk to. For patients at home or in a residential home, the District Nurses, patient’s GP and Clinical Nurse Specialists can offer support. For patients in a nursing home the home’s nurses along with the patient’s GP will offer care and support and will have arrangements with various faith representatives to provide further comfort and support. For patients in hospital or in the hospice, the ward nurses can support you or contact the Specialist Palliative Care Team. The hospital chaplaincy is also very happy to offer comfort and support to people of all faiths or none, and can be contacted by the ward nurses or doctors.

Caring well for your relative or friend at the end of their life is very important to us. Please speak to staff and ask any questions that occur to you, no matter how insignificant you think they may be.
