

Prescribing Guidance for Dying Patients

Most patients are comforted by the knowledge that medication is helpful and available if required at the end of their life.

The following flow charts are to be used as a guide for patients in their last hours of life. Further information is available from the West Midlands Palliative Care Physicians “Guidelines for the use of drugs in symptom control” www.wmpcg.co.uk and the Palliative Care Formulary.

PAIN AT THE END OF LIFE

Is patient already on opioid drugs and unable to tolerate or absorb oral medication?

YES

Patient on MR Morphine/Oramorph

- Divide 24 hour total dose of current **oral** Morphine by 3 and prescribe this as Diamorphine (mgs) via syringe pump over 24 hours
- Prescribe 1/6th Diamorphine syringe pump dose for breakthrough/rescue medication to be given hourly if needed
- Start syringe pump 4 hours before next oral opioid dose would have been due
- Discontinue oral opioid

Review within 24 hours

If extra medication has been needed for pain:

- Increase syringe pump dose by total amount of rescue Diamorphine given or by 50% whichever is less
- Adjust rescue/breakthrough dose to 1/6th of syringe pump Diamorphine dose to be given hourly if needed

**If pain is controlled, make NO changes
Continue to review dose requirements regularly**

Patient on weak opioid

(Codeine, Tramadol, Dihydrocodeine)

- Stop oral weak opioid
- Start Diamorphine 10mg/24 hrs by syringe pump soon after last oral dose
- Prescribe Diamorphine 2.5mg sub-cut hourly if needed for rescue/breakthrough pain

Review regularly and adjust as above

Fentanyl patch: continue patch and supplement with sc Diamorphine prn and add in a syringe pump **if** needed.

Renal impairment: GFR < 30 seek advice

NO

Scenario 1: "planning ahead"

Patient not in pain

- Prescribe Diamorphine 2.5mg - 5mg sub-cut hourly if needed
- If patient later develops pain, proceed to next box

Scenario 2: "act now"

Patient in pain

- Give Diamorphine 2.5mg sub-cut stat
- Prescribe and start Diamorphine 10mg/24h by syringe pump
- Prescribe Diamorphine 2.5mg sub-cut for rescue/breakthrough pain to be given hourly if needed

Review within 24 hours

If extra medication has been needed for pain:

- Increase syringe pump dose by total amount of rescue medication given or to 20mg/24hrs, whichever is less
- Increase rescue/breakthrough dose of Diamorphine to 5mg sub-cut to be given hourly if needed

If pain is controlled, make NO changes

Review within 24 hours

If extra medication has been needed for pain:

- Increase syringe pump dose by total amount of rescue Diamorphine given or by 50%, whichever is less
- Adjust rescue/breakthrough dose to 1/6th of syringe pump Diamorphine dose to be given hourly if needed

**If pain is controlled, make NO changes
Continue to review dose requirements regularly**

If symptoms persist or you need advice please contact the Medical or Outreach Team at Severn Hospice.

NAUSEA AND/OR VOMITING AT THE END OF LIFE

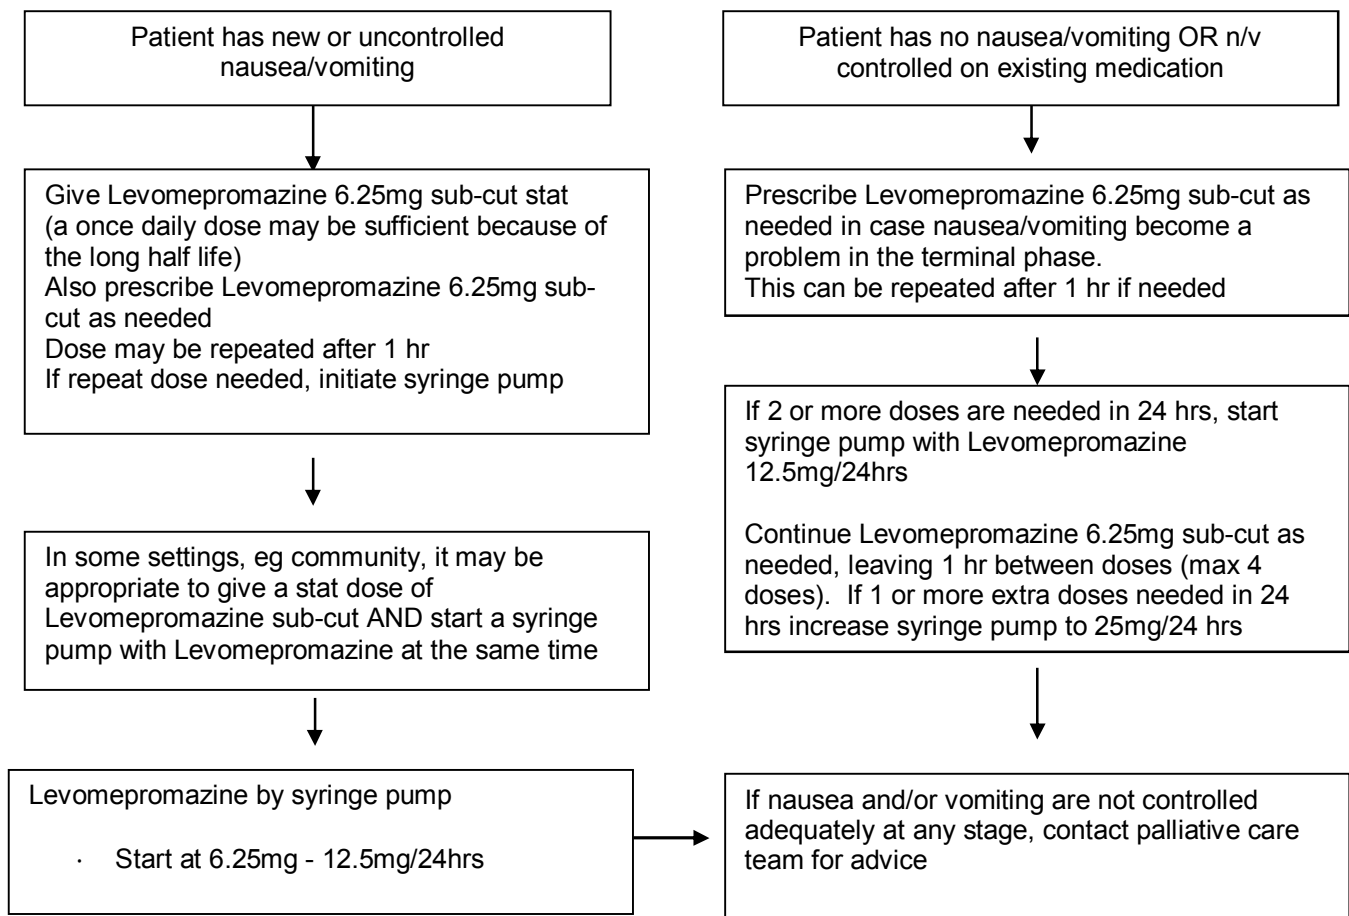

Important note: this guidance applies to the end of life ONLY

Effective palliation of nausea and vomiting earlier in the illness requires a cause-specific approach

Patients entering the terminal phase with **good symptom control** from an oral anti-emetic should **continue the same drug** given via a syringe pump when they are unable to take oral medication.

Domperidone should be replaced by Metoclopramide and Prochlorperazine (stemetil) by Cyclizine.

For new symptoms of nausea/vomiting that are difficult to control Levomepromazine (Nozinan) is recommended because of its broad spectrum of action.

Levomepromazine doses above 25mg/24 hr has a sedative effect.

If symptoms persist or you need advice please contact the Medical or Outreach Team at Severn Hospice.

RESTLESSNESS/AGITATION AT END OF LIFE

Consider and manage common causes of restlessness, eg. Urinary retention, faecal impaction, hypoxia and pain.

PATIENT IS RESTLESS/AGITATED

PATIENT IS NOT RESTLESS/AGITATED

Non-drug intervention is essential: reassurance, calm environment, use of sound and aromatherapy. Have you taken into account their spiritual needs?

Immediate management

Give medication sub-cut stat:

Midazolam 2.5 - 5mg

OR

Haloperidol 2.5mg

Start syringe pump:

Midazolam 10 - 20mg/24h

OR

Haloperidol 5mg/24h

Prescribe rescue doses sub-cut hourly:

Midazolam 2.5 - 5mg

AND/OR

Haloperidol 2.5mg

Planning ahead

Prescribe sub-cut hourly as needed

Either Midazolam 2.5mg

OR

Haloperidol 2.5mg

Review within 24 hrs

If 2 or more doses needed **and are effective**, start syringe pump of same drug (see left)

If 2 or more doses tried **but are not effective**, switch to the other drug or consider Levomepromazine (see below)

Persistent symptoms

Levomepromazine:

- Is an effective **sedative**
- It may be added to Midazolam (if Midazolam partly effective) or used to replace haloperidol.
- Start syringe pump at 25mg/24h
- Use rescue dose 12.5mg sub-cut hourly as needed

Higher doses are sometimes needed please discuss with the Drs or CNS at Severn Hospice if doses over 50mg/24hrs are used.

Review within 24 hours

Midazolam:

1-2 extra doses, increase driver dose by 50%,
3 or more extra doses, double driver dose
Continue rescue doses of 5mg sub-cut prn
If Midazolam driver dose >40mg/24hrs, consider Levomepromazine and seek advice.

Haloperidol:

Any extra doses, increase driver dose to 10mg/24h and continue rescue doses
Max haloperidol dose 20mg/24hrs

Midazolam and Haloperidol are very effective when used in combination

If symptoms persist or you need advice please contact the Medical or Outreach Team at Severn Hospice.

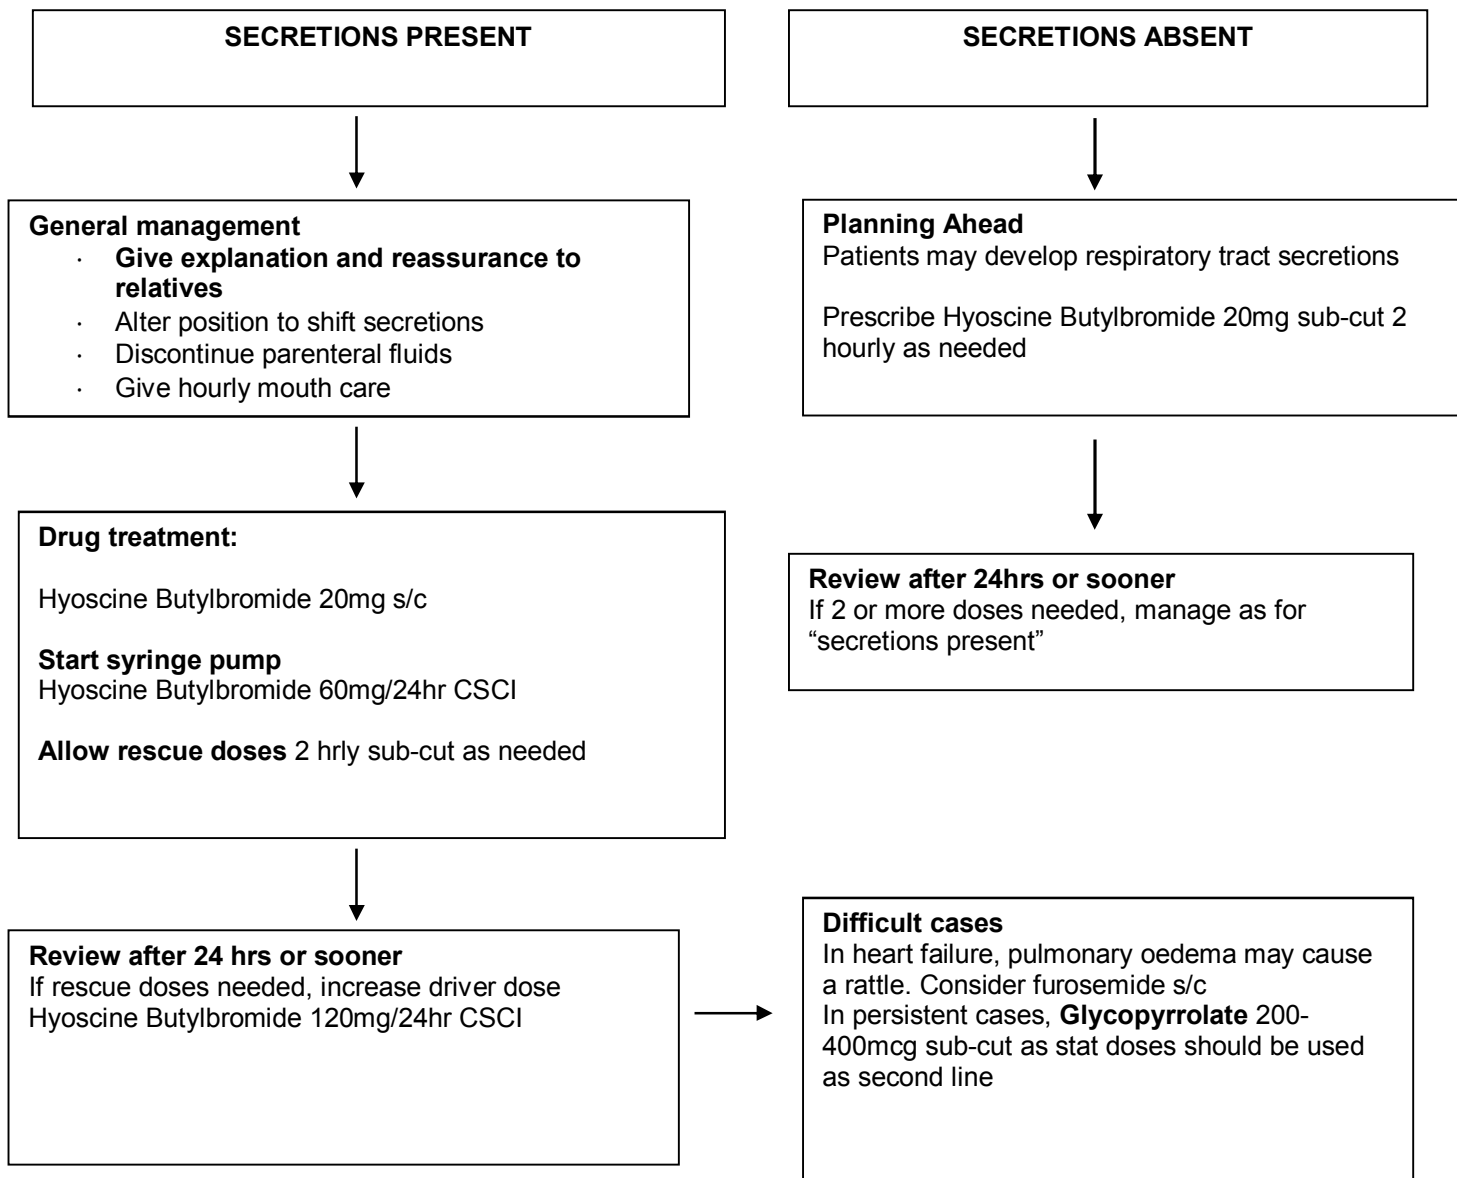

RESPIRATORY TRACT SECRETIONS IN A DYING PATIENT

Dying patients may be unable to cough effectively or swallow, which can lead to retained secretions in the upper respiratory tract. There is little evidence to support the effectiveness of drug treatment for this symptom. If the patient appears comfortable and not distressed reassure relatives and staff.

Hyoscine Butylbromide is our drug of choice to use for respiratory tract secretions at end of life

Hyoscine Butylbromide is non-sedating; Note it does not mix well with Cyclizine in a syringe and blocks the prokinetic antiemetic action of Metoclopramide

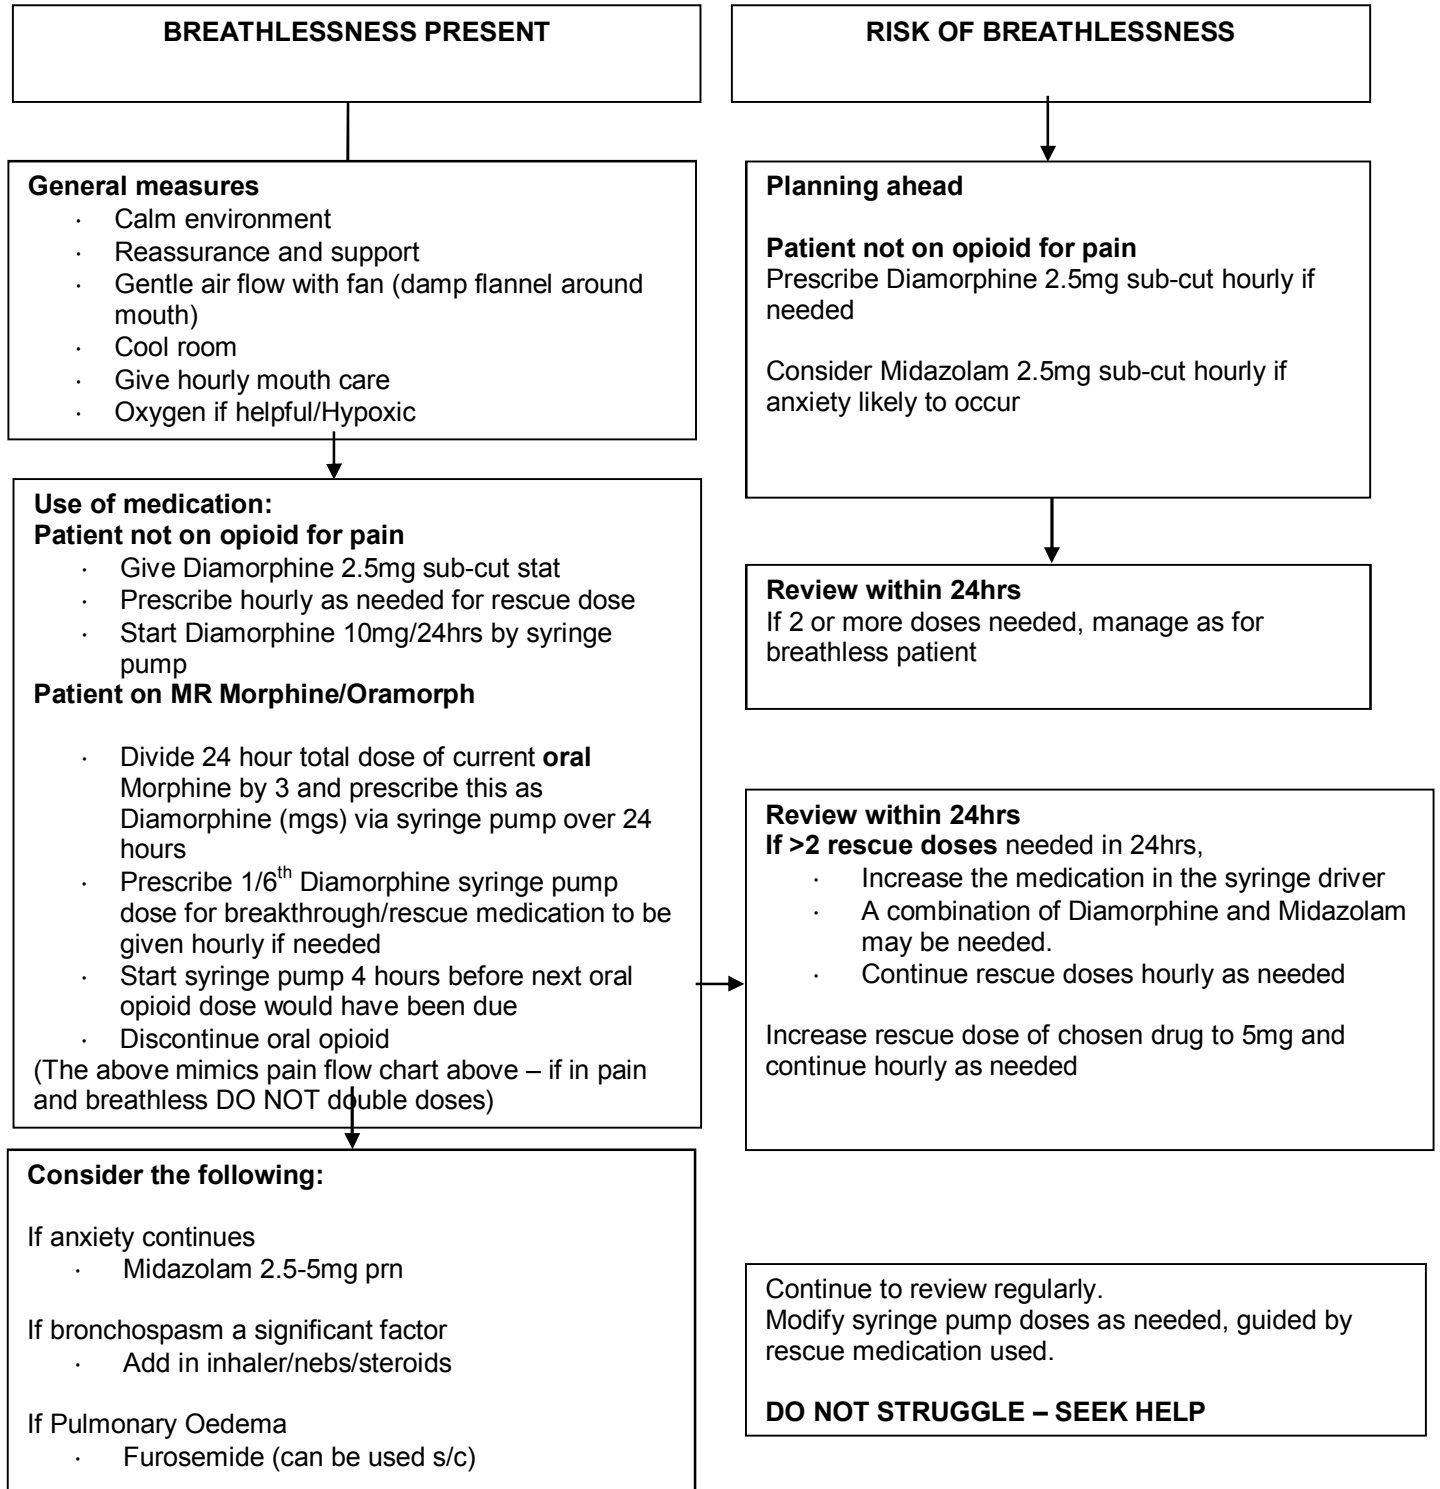

If rattling breathing is associated with breathlessness in a semiconscious patient add in an opioid +/- an anxiolytic sedative (midazolam)

If symptoms persist or you need advice please contact the team at Severn Hospice.

BREATHLESSNESS AT END OF LIFE

Terminal breathlessness is very frightening and must be treated as a serious symptom, untreated it can lead to escalation of symptoms, distress and terminal agitation.

If symptoms persist or you need advice please contact the team at Severn Hospice.
